The Case: Cross-Sector Scam Response

Scams are an increasingly complex problem involving financial institutions, telecommunications providers, digital platforms, government agencies, law enforcement and community support services.

A person affected by a scam might:

- receive a fraudulent message through a telecommunications network;
- follow a link hosted on a digital platform;
- disclose identity or account information;
- transfer money through a financial institution; and
- require assistance from several organisations.

In 2025, Australians made more than 480,000 scam reports across major reporting organisations. Reported financial losses exceeded $2.18 billion. Source: ACCC.

Scam activity crosses organisational boundaries, while people affected by scams may be distressed, vulnerable or uncertain about where to seek assistance. People often report a suspected scam to the first organisation they believe can help. **That organisation may see only one part of the incident and may need to coordinate with other organisations to provide an effective response.**

The consortium: ScamSafe Alliance

A fictional consortium called the ScamSafe Alliance has been established involving:

- banks and payment providers;
- telecommunications providers;
- digital platforms;
- government scam-reporting services;
- identity-recovery and victim-support organisations; and
- community organisations supporting people experiencing vulnerability.

The ScamSafe Alliance has agreed that scam response requires clearer responsibilities, consistent information, trusted referral pathways and effective coordination.

The approved AI initiative

The ScamSafe Alliance has approved the creation of an AI-enabled solution that supports authorised frontline employees who receive reports of suspected scams. The proposed solution would help frontline staff:

- gather and structure relevant information;
- identify missing, conflicting or uncertain information;
- recognise indicators of urgency or vulnerability;
- access approved scam-response guidance;
- support selection of an appropriate response pathway;
- prepare guidance for the affected person;
- identify when specialist or human intervention is required; and
- prepare consistent case records and handovers for use by other organisations.

Recommendations are made to the authorised frontline employee. The employee remains responsible for reviewing the recommendation, communicating with the affected person and initiating any action within their authority. The intended operating principle is that the AI supports analysis and prepares recommendations. Authorised people verify, communicate and act.

The AI must not independently confirm that a scam has occurred, block transactions, modify accounts, contact another organisation or make consequential decisions about an affected person.

Your Task

Your team has been engaged to determine how the approved initiative could operate effectively. You must deliver the following:

Part A: Presentation	**Deliver a six-minute presentation, using a maximum of six slides, that communicates:** • How your AI-enabled solution addresses the ScamSafe Alliance's requirements; • What your AI-enabled solution will do and what it will not do; • How it will be embedded within the organisations who are part of the ScamSafe Alliance. As part of the six minutes, the presentation must include a **60 to 90-second video** demonstration of the prototype. See Part B below. Note: • Not all team members need to speak during the presentation, but all team members **must be present.** • The use of speaker notes, cue cards, phones or other speaking aids is not permitted during the presentation. If any team member uses these aids, the team's mark for that component will be capped at 55%. This restriction does not apply to an appropriate adjustment specified in a student's Equitable Learning Plan.
Part B: Prototype	**Create a functional prototype of your AI-enabled solution.** Your prototype could be a chatbot, AI agent, vibe-coded application, AI-enabled workflow, hybrid solution, or another justified configuration. **The key requirement is that it actually works**. You should be able to provide it with information about a scam case, show the prototype processing that information, and demonstrate it producing useful output for a frontline employee. A static mock-up, storyboard, set of interface screens, or role-play of how a proposed system might work is not sufficient. The prototype and demonstration must use synthetic case information. Do not enter real personal, sensitive, confidential or commercially restricted information into the prototype or any AI service. For prototype purposes, your team may create a limited fictional set of scam-response guidance. Clearly identify this guidance and any associated assumptions as synthetic. Record a **60 to 90-second video** demonstration of your prototype receiving information, operating and producing useful output(s). **This recording must be included within the six-minute presentation and submitted separately through Moodle. You must also submit a working link for which the teaching team has been granted access, or a copy or export of the code, prompts, instructions, configurations and other materials required to understand how the prototype was constructed.**
Part C: Live Oral Defence	**Immediately after the presentation, your team will participate in a six-minute oral defence. Your team will be asked a series of questions about your presentation and prototype. Questions may examine:** • The robustness of your proposed solution if there is a change or unexpected incident; • Your understanding of the case; • How the prototype works; • Why you selected the particular AI approach; • Assumptions and limitations; • Human and AI responsibilities. Note: • Any team member may be asked a question. Other team members may add to an answer when they can contribute new information or resolve an issue. The defence is marked as a team. • The use of speaker notes, cue cards, phones or other speaking aids is not permitted during the oral defence. If any team member uses these aids, the team's mark for that component will be capped at 55%. This restriction does not apply to an appropriate adjustment specified in a student's Equitable Learning Plan.

Both components are assessed at a team level. All team members normally receive the same mark for the presentation and oral defence.

Submission Requirements

One team member must submit the following through Moodle on behalf of the team:

- the PowerPoint presentation in PPT or PPTX format;
- the prototype demonstration video in MP4 or MOV format; and
- a working link for which the teaching team has been granted access, or a copy or export of the code, prompts, instructions, configurations and other materials required to understand how the prototype was constructed.
